

CampusNexus

POWERED BY POLYNEXUS

The CampusNexus Mobile App

Your campus, in every student's and faculty member's pocket — built as a companion to the CampusNexus web platform your institution already runs.

An overview for institutions & administrators

One Platform, Two Experiences

Your administrative team already runs your institution from the CampusNexus web console. The mobile app isn't a second system to manage — it's the same platform, reaching students and faculty wherever they are on campus.

CampusNexus is built on a simple idea: the people who manage your institution (Management, Administrators) need a powerful desktop-grade console for reports, records, payroll, and fee reconciliation. The people who *live* on campus day to day — students and faculty — need something faster: a phone in their pocket that handles attendance, notifications, and quick lookups without ever opening a laptop.

The mobile app is purpose-built for that second group. Nothing about your institution's administrative data, financial records, or staff management moves to a phone — that stays exactly where it is today, on the secure web console, accessible only to the people you've authorized.

Who Gets the App

Students FULL MOBILE ACCESS	Faculty FULL MOBILE ACCESS	Bus Drivers ROUTE-ONLY ACCESS	Admin / Management WEB CONSOLE ONLY
---------------------------------------	--------------------------------------	---	---

This isn't a limitation — it's a deliberate design choice. Sensitive administrative work (payroll, audit trails, fee reconciliation, bulk student/staff records) is exactly the kind of data that should *never* be one lost or stolen phone away from exposure. Your Management and Administrator accounts keep the full power of the web console; nothing is taken away from them.

Your data stays where you put it. Every mobile screen only shows what that specific student or faculty member is personally entitled to see — never another student's records, never institution-wide reports, never financial data.

Everything a Student Needs, One Tap Away

A daily-use app, not a filing cabinet — designed around the handful of things a student actually needs while they're on the move.

● Face-Recognition Attendance

Students check into class with a quick face scan — no paperwork, no manual roll calls, no proxy attendance.

● Live Bus Tracking

Real-time location of their subscribed bus, plus a simple QR scan to board — with an alert when the bus is a few minutes away.

● Fee Payments

See what's due and pay directly from the app — no visits to the accounts office for routine payments.

● Timetable & Exams

Today's classes, upcoming exam dates and rooms, and results the moment they're published.

● Assignments

See what's due and submit directly — including photographing handwritten work from their phone.

● Hostel & Library

Room allocation status, maintenance requests, and library due-dates — all without a front-desk visit.

● Placements (TPO)

Browse and apply to campus placement drives, and track application status in real time.

● Announcements

Instant push notifications for everything from exam schedule changes to campus events — nothing gets missed.

The result: fewer queues at the accounts office, fewer "did you see the notice?" conversations, and an attendance system that's both faster and harder to game than a paper register.

Attendance That Runs Itself

Faculty get a focused mobile toolkit built around one job: running the classroom, not managing the institution.

- **Start a class session** from their phone and watch attendance fill in live as students check in
- **Review borderline cases** — approve a student's manual attendance request if their face scan didn't go through
- **See today's schedule** at a glance
- **Apply for leave** and check their balance without a form or a trip to HR
- **Get notified** the moment a new institution announcement goes out

Everything else a faculty member does — grading, setting assignments, reviewing department analytics — stays on the web console, where a full keyboard and screen make that work faster anyway. The mobile app handles what actually happens while they're standing in a classroom.

For Your Transport Team

Bus drivers and conductors get their own minimal, single-purpose mobile view: today's assigned route, the stop list, and how many students are expected versus how many have boarded — nothing else. It's built for someone glancing at a phone mounted on a dashboard, not browsing a menu.

Safety by design: real-time bus tracking and boarding confirmation give your transport office (and, indirectly, parents who ask) a live, verifiable answer to "where is the bus, and who's on it" — without adding any new administrative burden.

Built With Consent, Not Around It

Face-recognition attendance means the app processes biometric data — and we treat that with the seriousness it deserves. Before any student's face is ever enrolled, they (or, for minors, their guardian) see a clear, plain-language consent screen explaining what's being collected, why, and how it's used. Nothing is captured silently.

- Consent is explicit, logged, and can be withdrawn at any time from the student's own profile
- Biometric data is used strictly for attendance verification within your institution — never shared, sold, or reused for any other purpose
- Manual attendance remains available as a fallback for any student who opts out or whose scan fails
- Data handling follows the DPDP Act's consent and grievance-redressal requirements out of the box, with a designated Data Protection Officer contact point built into the platform

Bottom line for your institution: you get the operational benefits of biometric attendance — accuracy, speed, no proxy attendance — without taking on the compliance burden yourself. That's built into the platform.

What's Next

Our current mobile release is deliberately focused on Students, Faculty, and Transport staff — the roles that benefit most from an always-in-hand app. A future release will bring a lightweight approvals & alerts view for Department Heads and Management (leave approvals, broadcast announcements, push alerts) — without turning the phone into a second copy of the full administrative console.
